SpaceTravel

SpaceTravel app is a travel app that makes space traveling in our Solar system possible. At first users must log into the application. They can choose from three different profile options:

- Ordinary user (Traveller)
- Astronaut (Guide)
- Governor

The **Traveller** can log into the application without any extra credentials than name and password. He can choose from existing voyages around the Solar system, log into or log out of them (if he has enough credit on his account and there is still space available for given voyage). He can also preview the journey, what space objects (planets, moons, comets, satellites, etc.) he would encounter during the voyage and see the info about them. He is unable to create, modify or delete the voyages.

The **Guide** must provide secured key to log into his account. He can create new voyages or edit and manage existing ones (by adding or removing space objects where the travellers can go), but before they can be shown to the travellers, they need to be approved by the **Governor**, who oversees accepting and cancelling these voyages. Governor also needs to provide special key to be able to log into his account.
